`std::string add (std::string firstNum, std::string secondNum);`

This function adds two numbers. Both parameters have to be `std::string`.

Example: *add(“3”, “564”); returns “567”.*

`std::string multiplication (std::string number, int multiplier);`

This function multiply two numbers.

Example: *multiplication(“8”, 3); returns “24”.*

`std::string squareRoot (std::string number);`

This function returns square root of *number*.

Example: *squareRoot(“25”); returns “625”.*
